

## **midPhase upgrades all packages and releases new website.**

Chicago, IL. - midPhase Services, Inc., a provider of shared web hosting solutions, announced today the launch of their new website, and upgraded bandwidth limits on all shared hosting packages, a move the company says will help to eliminate bandwidth concerns for small businesses.

The company said today that it has increased the bandwidth on all three of the midPhase web hosting plans to include unmetered bandwidth. Unmetered bandwidth will be available to all customers that do not have image gallery websites, or download websites. Customers that do not qualify for unmetered bandwidth by serving adult content, or file archives will also experience a bandwidth increase of 10GB per month, bringing the total allotted bandwidth limit to 60GB for the companies flag-ship package, Mega-Phase.

"We have always passed our reduced bandwidth prices on to our customers by providing ample bandwidth allowances, but many customers are still concerned that they will be hit with a large overage bill. By offering unmetered bandwidth, we anticipate that we will eliminate this concern for small businesses, with small to medium-size websites," says vice president of customer care Mark Choi. "In addition to the bandwidth upgrade, we have unveiled a new website that allows for better navigation, and easier access to the tools provided to all midPhase customers."
