

How To Resolve A Website Security Certificate Error in Plesk

Why do I get the following warning message when logging into Plesk?: "There is a problem with this website's security certificate." I can still log-in but the explorer bar goes pink.

Plesk is secured with an SSL on the server name. The information is still secure but the SSL is not directly related to your domain. You can't create an SSL for plesk assigned by your domain as this is a service provided by the server, not your domain. You can log in using the server name with a URL like <https://win09.midphase.com:8443/login.php3>
