

How To Configure WordPress CloudFlare

CloudFlare is a content delivery system that can significantly reduce the load times on your website. All premium WordPress hosting accounts include Cloudflare. To configure CloudFlare, follow the steps in this article.

Step 1: Navigate to the CloudFlare section of CHI

To configure your free CloudFlare account through Midphase, you will need to log into your CHI control panel with your username and password.

Click the WordPress icon as seen below.

Click the domain that you would like to add CloudFlare to from the top left hand corner of your screen.

Then click the "CloudFlare" tab from the menu options at the top of your screen.

Step 2: Activate CloudFlare

Within the CloudFlare section you will need to enable the service in order to add it to your domain.

Step 3: Configure CloudFlare settings

Once the service is active, you will have many different settings to turn on or off depending on how you would like the service to function.

If you have questions about any of the settings you can click the question mark button to contact our technical support team.
