

How To Resolve The File does not exist Messages In My Log

This article contains information about the error "File does not exist" in log files.

The log file also keeps track of what files are being requested and not served. For example if you have File does not exist: /public_html/robots.txt this means that someone, possibly a robot was looking for a file on your site that may have previously existed. To remove this error from future log files you simply upload a new robots.txt file.
