

What Is A Private Nameserver

This article contains information about private name servers.

Private nameservers are DNS Servers that point to your domain name instead of that of Midphase.com.

To have a private nameserver, you first need to have two static IPs on your Account. Then you create a dns entry for *ns1.yourdomain.com* and *ns2.yourdomain.com*; once you have done that, you must register the name servers with the registrar. After your private name servers are registered with the registrar, you can start to use them.

All Midphase Reseller accounts are eligible for Private nameservers.
